Unit 42 Warns of Large-Scale FortiBleed Credential Attack Campaign

Palo Alto Networks' Unit 42 published a June 19 threat brief on a large-scale credential-attack campaign, dubbed FortiBleed, primarily targeting Fortinet devices, with MSSQL and Sophos systems also observed. The report details password-spraying using credential lists sourced from prior breaches and dark-web postings, noting an initial access broker claimed responsibility. Unit 42 provides defensive guidance: enforce MFA for remote access, adopt Zero Trust and ZTNA, rotate default credentials, disable unused accounts, and patch promptly. Findings were shared with Cyber Threat Alliance members for rapid protection deployment.

Prisma AIRS Adds Local Cloud Region in Japan

Palo Alto Networks announced on June 19 the expansion of Prisma AIRS with a new local cloud location in Japan, enabling domestic data residency and low-latency processing. Prisma AIRS 3.0 is positioned as a comprehensive AI security platform that scans models, agents, and artifacts before deployment, protects runtime behavior, and provides unified posture management across models, applications, agents, and datasets. The new region gives Japanese organizations high-performance, in-country access to AI security capabilities, supporting secure adoption of generative and agentic AI for large-scale digital transformation initiatives.

Fortinet Responds to FortiBleed FortiGate Credential Compromise

Fortinet's June 19 PSIRT analysis addresses FortiBleed, a credential-harvesting campaign against FortiGate devices that reuses credentials from prior incidents and brute-forces weak passwords lacking MFA. Fortinet stresses this is not a new vulnerability or advisory, says it has identified potentially affected systems, is notifying impacted customers, and is cooperating with government agencies. Recommended actions include resetting credentials, enabling MFA, upgrading to FortiOS 7.4/7.6/8.0 with PBKDF2 hashing, and restricting external management. By June 21, evidence of active underground credential trading emerged alongside CISA and UK NCSC advisories.

Agents Week: Zero Trust and Non-Human Identity Controls for AI Agents

During Agents Week (June 19), Cloudflare unveiled security tooling to make agents secure by default. The Cloudflare One stack lets an agent plan, deploy, and manage a Zero Trust environment; Managed OAuth for Access enables one-click, RFC 9728-based agent authentication to internal apps without insecure service accounts. New non-human identity controls add scannable API tokens, resource-scoped permissions (GA), and improved OAuth visibility. Cloudflare also shipped an enterprise MCP governance reference architecture with Shadow MCP detection in Gateway and Code Mode to cut token costs, extending its platform to govern autonomous agent access.

Cloudflare Mesh and Temporary Accounts Power the Agentic Cloud

Cloudflare's Agents Week (June 19) introduced infrastructure to deploy and run AI agents at Internet scale, framed as 'Cloud 2.0.' Cloudflare Mesh delivers secure private networking with Workers VPC, giving agents scoped access to private databases and APIs without manual tunnels. Temporary Cloudflare Accounts let an agent deploy a live Worker instantly via 'wrangler deploy --temporary' in claimable 60-minute sessions. New agent compute environments offer full OS-style and millisecond-start options plus a Git-compatible agent workspace, alongside an Agent Toolbox of inference, search, memory, voice, email, and browser primitives.

HPE Juniper QFX5252 Switch Powers AMD Helios AI Rack

Coverage emerging June 19 from HPE Discover 2026 detailed the HPE Juniper QFX5252 scale-up switch tray built for AMD's Helios AI rack. Each tray packs dual Broadcom Tomahawk 6 chips for 204.8 Tbps of switching capacity and runs UALink-over-Ethernet on SONiC with AI-native operations, enabling open-standard scale-up to 1,024 accelerators per pod without NVLink lock-in. The liquid-cooled design, plus the QFX5140 inference switch and Marvis AI across Aruba Central, positions Juniper networking as core to HPE's AI Data Center stack and its bet that the network determines AI scale.
