GlobalProtect VPN Auth-Bypass Flaw (CVE-2026-0257) Now Actively Exploited

Palo Alto Networks' PAN-OS GlobalProtect authentication-bypass vulnerability, CVE-2026-0257, came under active exploitation over the weekend against unpatched gateways and portals. Attackers forged authentication cookies to bypass GlobalProtect controls and establish unauthorized VPN sessions directly into internal networks. Rapid7 observed successful exploitation across multiple customers, and CISA added the flaw to its Known Exploited Vulnerabilities catalog, ordering federal mitigation by June 1. Panorama and Cloud NGFW are unaffected. Palo Alto urges customers to apply the May patch, enforce mitigations, and hunt for indicators of compromise on internet-facing remote-access infrastructure.

ACQUISITION

Palo Alto Networks ~AI

2026-05-29

Palo Alto Networks Completes Acquisition of Portkey to Secure AI Agents

Palo Alto Networks announced on May 29 that it has completed its acquisition of Portkey, making the company's AI Gateway the core of the Prisma AIRS platform. The resulting Prisma AIRS AI Gateway provides a unified control plane to identify, authenticate, and authorize every AI agent interaction in real time, with centralized governance, a unified API to LLMs, an agent registry, semantic routing, caching, and runtime security including agent artifact scanning and automated red-teaming. It leverages Idira identity security for least-privilege enforcement, aiming to reduce fragmentation and move autonomous AI workloads from development to at-scale production.

Check Point Launches Agentic Exposure Validation to Counter Autonomous AI Exploitation

Check Point Software launched Agentic Exposure Validation (AEV) for its Exposure Management platform on May 29, deploying AI agents that reason like attackers to prove what is genuinely exploitable on an organization's external attack surface. AEV correlates exposure data with asset context, live exploit research, threat intelligence, and existing protections, running a safe proving loop to validate, pivot, or discard threats rather than relying on static CVE severity. Early engagements show agents generating novel exploits for vulnerabilities with no known public exploit code. AEV is available now within Check Point Exposure Management as a CTEM validation layer.

Cloudflare Builds Town Lake Data Platform with Skipper AI Data Agent

Cloudflare detailed on May 29 how it built Town Lake, an internal unified analytics platform, alongside Skipper, an AI data agent. Town Lake provides a single analytics layer built on Apache Trino with Iceberg catalogs and R2 storage, letting teams query internal data via SQL or natural language under strict default-closed access controls. Skipper translates natural language into SQL, inspects metadata, runs queries, and refines results. Used heavily for billing analytics, business intelligence, support, and security, the system emphasizes secure, auditable access with per-row controls, time-bound credentials, and PII detection, and doubles as a testbed for Cloudflare's developer products.

Redesigned Cloudflare One Client for macOS Enters Beta

Cloudflare released a new beta of the Cloudflare One Client for macOS (version 2026.5.1155.1) on May 29. The update introduces a redesigned client UI offering a cleaner, more intuitive interface with easier access to common actions and connection information. The refresh targets Cloudflare's Zero Trust and SASE users on macOS, improving day-to-day usability of WARP-based secure connectivity within the Cloudflare One platform.

Cloudflare Realtime WebSocket Adapter Adds Auto-Reconnect and WebRTC Media Buffering

Cloudflare announced on May 29 an upgrade to its Realtime SFU WebSocket adapter that adds automatic reconnect and media buffering for WebRTC streams delivered to WebSocket endpoints. In Stream egress mode, if an endpoint briefly disconnects the SFU now retries for up to five seconds and resumes media delivery automatically without code changes, using a small bounded backlog for live audio and resuming video from the latest frame. The improvement boosts resilience for long-running media pipelines such as recording, transcription, and real-time AI analysis consuming edge-delivered media, though recovery remains best-effort and not gapless.

Cloudflare Radar Post-Quantum TLS Checker Now Detects Handshake Bugs

Cloudflare updated its Radar post-quantum TLS support checker on May 29 so it now detects TLS bugs during the handshake and provides details plus remediation guidance for affected hosts. Newly identified issues include Split ClientHello, HRR Failure, and Unknown Keyshare. Bug details are accessible via the `/post_quantum/tls/support` endpoint, and operators can test hosts directly on the Post-Quantum Encryption page. The enhancement helps organizations validate and harden quantum-safe TLS deployments as post-quantum cryptography adoption accelerates.

Barracuda Highlights Telecom Threat-Intelligence Sharing via C2 ISAC

Barracuda published analysis on May 29 examining the C2 ISAC, a real-time threat-sharing alliance among eight U.S. telecom providers including AT&T, Charter, Comcast, Cox, Lumen, T-Mobile, Verizon, and Zayo. Motivated by attacks such as Salt Typhoon and rising AI-enabled threats, the alliance aims to detect and respond faster, cut duplicated research, and contain costs. Barracuda frames cross-industry collaboration as increasingly essential amid strained public-sector resources, discussing legal protections and cultural barriers to intelligence sharing and urging a shift toward proactive, near real-time defense across critical infrastructure sectors.

Mindgard Launches GuardBuster for Real-World AI Guardrail Validation

Mindgard launched GuardBuster on May 29, a new offering that independently validates and measures AI guardrails and gateways under real-world, adversarial conditions. GuardBuster tests defenses against adaptive attacks that go beyond static lab prompts, including prompt injection, jailbreaks, coercion, context manipulation, token fragmentation, adversarial ML evasion, and multi-turn manipulation. The goal is evidence-based security decisions: showing which attacks a guardrail stops, how systems respond under pressure, and where defenses fail, so enterprises can assess risk beyond vendor claims or benchmark scores. GuardBuster emphasizes continuous, production-environment testing to harden defenses as attacks evolve.
