Palo Alto Networks Launches Unit 42 Threat Intelligence Offering

Palo Alto Networks introduced Unit 42 Threat Intelligence, widening customer access to its proprietary research. It has two parts: Cortex XTI, which embeds Unit 42 intelligence directly into the Cortex platform to align global threat visibility with each customer's environment and prioritize actors, campaigns, malware and exposures; and Unit 42 Threat Intel Services, analyst-led engagements delivering tailored insights grounded in active campaigns. The company positions scale plus environmental context as the differentiator, pushing intelligence into SOC prevention, detection, hunting and investigation workflows.

Palo Alto Networks and Google Cloud Target AI-Generated Malware

Palo Alto Networks and Google Cloud announced an integration embedding WildFire advanced malware sandboxing into Google Cloud NGFW Enterprise, delivering real-time inline protection against AI-generated malware and zero-day ransomware. Files extracted from network traffic are analyzed within Google Cloud regions, with verdicts enforced inline across inbound and internal traffic and no redirection to external sandboxes. The capability leverages Precision AI, preserves application performance, supports regional data-residency requirements, and is managed from the Google Cloud Console. It is currently available in preview.

Palo Alto Networks Sets Q4 and FY2026 Earnings Date

Palo Alto Networks said it will report fiscal fourth quarter and full fiscal year 2026 results after U.S. markets close on Tuesday, September 1, 2026, covering the quarter ended July 31, 2026. A live video webcast with management follows at 1:30 p.m. Pacific, with a press release issued beforehand and a replay archived for one year. The report will be the first full-year results following the company's CyberArk acquisition earlier in 2026.

Unit 42 Research Exposes New Attack Surface in Passwordless Authentication

Palo Alto Networks' Unit 42 published research detailing a novel attack surface in passwordless authentication, showing how passkey implementations can be abused despite being marketed as phishing-resistant. The analysis walks through weaknesses in registration and recovery flows and how attackers can subvert trust assumptions in passwordless deployments. Unit 42 outlines detection considerations and hardening guidance for enterprises rolling out passkeys, reinforcing that identity remains a primary adversary target as organizations retire passwords.

Fortinet and Crime Stoppers International Launch First Live Cybercrime Bounty

Fortinet announced that its Cybercrime Bounty program, run with Crime Stoppers International, is now live. The program pairs Crime Stoppers' anonymous reporting channels with FortiGuard Labs threat intelligence to collect, validate and route actionable cybercrime intelligence to law enforcement. Fortinet confirmed the anonymous reporting channel is operational, validation and escalation processes are established, and the first live bounty, Operation Silent Vector I, has launched with a named target. The move positions Fortinet's intelligence apparatus as a direct enabler of law-enforcement disruption.

Cisco Named a Leader in 2026 Gartner Magic Quadrant for UCaaS

Cisco announced it was again named a Leader in the 2026 Gartner Magic Quadrant for Unified Communications as a Service, marking its eighth consecutive year in the Leaders quadrant. The company credited both its completeness of vision and ability to execute, framing the recognition as validation of its Webex strategy and continued investment in AI-driven collaboration experiences. The recognition supports Cisco's broader platform narrative of consolidating collaboration, networking and security capabilities under a single vendor.

Cisco Expands IAM Portfolio to Govern Non-Human and Agentic AI Identities

Cisco detailed an expansion of its identity and access management portfolio to cover non-human identities, including service accounts, API keys, workload tokens, SaaS grants and AI agents, which now outnumber human identities by as much as 50x. Capabilities from the Splunk, Galileo Technologies and Astrix Security acquisitions are being folded into Cisco Identity Intelligence, Duo and Secure Access, with Cloud Control, Agent Builder and Codex guardrails enforcing policy on agent behavior. Cisco's pitch is a zero-trust, context-aware control plane that sits directly in the agent's path.

Cisco Executive Testifies to US Senate on AI's Impact on Network Infrastructure

Cisco's Bob Everson testified before the US Senate Subcommittee on Telecommunications and Media at a hearing on intelligent networks powering AI. He reported AI inference traffic grew fourfold in eight months and is increasingly uplink-intensive from prompts, sensor data and agent activity, with one tested AI agent generating about 450% more traffic than a human, roughly 70% inference-related. Cisco cited 34% AI traffic growth in campus and branch networks over the past year, projecting about 96% next year, and highlighted the shift toward distributed, smaller specialized models.

CrowdStrike 2026 Threat Hunting Report: AI Embedded Across Adversary Operations

CrowdStrike released its 2026 Threat Hunting Report, concluding AI is now a tool, target and force multiplier for adversaries. Findings include a campaign issuing nearly 200,000 AI model requests in two minutes, DPRK-nexus STARDUST CHOLLIMA poisoning 131 Mastra AI framework npm packages, and 87% of software registry threats in 1H 2026 involving malicious npm packages. Exploitation windows have collapsed, with 88% of proof-of-concept exploits weaponized within 48 hours. Cloud-focused eCrime rose 171% and device-code phishing surged 15x.

Check Point Launches AI Network Firewall to Close the Network's AI Blind Spot

Check Point launched its AI Network Firewall as part of firewall software release R82.20, extending AI security to prompts, model calls and autonomous agent actions from customers' existing firewall deployments. Delivered through the company's AI Defense Plane with no new infrastructure required, it gives security teams visibility and control over AI use by employees, applications and agents, with centralized policy management extended across Check Point SASE and SD-WAN. The release adds dynamic zero-trust enforcement and micro-segmentation across IT and OT environments, and is available now.

Product Launch Cloudflare Platforms 2026-08-03

Cloudflare Introduces Billable Usage API for Programmatic Cost Visibility

Cloudflare introduced the Billable Usage API, a single self-serve endpoint returning account-wide usage and cost data broken down by product and service period across Workers, R2, D1, Workers AI, Vectorize, Images and Stream. Built on the FOCUS specification, records include service name, charge period, pricing quantity and contracted cost, with per-zone attribution and daily refreshes moving toward near real-time. Access requires an API token with Billing Read permission, and Cloudflare partnered with Vantage to ingest the data for FinOps cost reports, budgets and alerts.

Source: <https://blog.cloudflare.com/billable-usage-api/>

Product Launch Cloudflare AI Data Delivery 2026-08-03

Cloudflare Launches @cloudflare/computer Agent Runtime

Cloudflare released an early preview of @cloudflare/computer, an open-source agent runtime that gives AI agents a "computer" abstraction while the platform decides whether code runs in an isolate, container or browser. The design targets running under 10% of agent tasks in containers, keeping coding, audio/video manipulation and document creation workloads primarily in cheaper, faster isolates. Cloudflare positions the library as a way to scale agentic workloads efficiently on Workers and invites early experimentation as it learns from customer usage.

Source: <https://blog.cloudflare.com/cloudflare-computer/>

Product Launch Cloudflare AI Data Delivery 2026-08-03

Cloudflare Details Serving Kimi and GLM Models at Scale on Workers AI

Cloudflare detailed how it serves memory-intensive open frontier models — Moonshot's Kimi K-series and Z.ai's GLM — at scale on Workers AI. Layered on prefill/decode separation, the techniques include quantizing the KV cache, compressing model weights and protecting shared caches to support higher request density without sacrificing accuracy. Cloudflare cited SGLang-based benchmarking and outlined next steps including broader FP8 KV caches, NVFP4 weight validation on Blackwell GPUs and low-cost integrity checks, all aimed at lowering inference cost for customers.

Product Launch Cloudflare Application Delivery (ADCs) 2026-08-03

Cloudflare Workers and Containers Now Support Inbound TCP and gRPC

Cloudflare closed its long-standing HTTP-only gap by adding inbound TCP support to Workers and Containers via Spectrum. A new connect(socket) handler lets a Worker accept raw TCP connections and forward sockets to Containers or Durable Objects, enabling full-duplex gRPC workloads with automatic gRPC-web to gRPC translation. Workers can now act as both gRPC servers and clients, supporting unary and server-streaming APIs. The capability is in private beta, extending Cloudflare's edge delivery reach to non-HTTP protocols and low-latency, near-client processing.

AWS Durable Execution SDK for .NET Now Generally Available

AWS made the Lambda Durable Execution SDK for .NET generally available, joining existing Python, TypeScript and Java support. Developers install the SDK via NuGet, author long-running durable workflows in C#, and deploy using the AWS Extensions for .NET CLI with the same tooling already used for Lambda functions. The release extends AWS's serverless orchestration capabilities to enterprise .NET shops, reducing the need for external workflow engines when building resilient, long-lived application logic on Lambda.

Arista Warns of Active Exploitation of Critical VeloCloud Orchestrator Flaw

Arista disclosed that attackers are actively exploiting CVE-2026-16812, an unauthenticated OS command-injection vulnerability in on-premises VeloCloud Orchestrator carrying a maximum CVSS 10.0 score. The VCO web interface is exposed by default with no configuration-based mitigation, letting remote attackers run privileged commands, fully compromise the orchestrator host and potentially pivot to managed VeloCloud Edge devices. Patches exist for the 5.2, 6.1 and 6.4 branches; a remediated 7.0 build was still pending. Arista urged customers to restrict web interface access and hunt for anomalous activity.

WARP Client Beta Releases for Windows and macOS

Cloudflare published beta releases of its WARP client for Windows and macOS via the developer changelog. The updates continue iterative hardening of the Zero Trust endpoint agent that connects devices into Cloudflare One, covering connectivity, device posture, and platform-specific fixes. Beta channels let administrators validate changes ahead of general availability rollouts.

Cloudflare Launches an API for MoQ: Provision Your Own Isolated Relays

Cloudflare launched a provisioning API that lets developers create isolated Media over QUIC relays with separate publisher and subscriber credentials and per-app access controls. Relays become available globally across Cloudflare's network within seconds, removing the need to deploy servers or configure load balancing. The API supports MoQ Transport drafts 14 and 16 with authentication, and is free at any scale during the beta preview period.

Amazon Aurora DSQl Adds Multi-Region Cluster Support in Four More Regions

AWS expanded Amazon Aurora DSQl multi-Region cluster availability to four additional Regions. Multi-Region clusters provide active-active, strongly consistent distributed SQL with automatic failover, letting customers run resilient applications across geographies without managing replication. The expansion broadens data residency and latency options for globally distributed workloads on AWS's serverless distributed SQL service.

AWS Transform Agent Builder Toolkit Simplifies Building and Publishing Custom Agents

AWS introduced the Transform Agent Builder Toolkit, which streamlines how teams build, package, and publish custom agents on AWS Transform. The toolkit standardizes agent definitions and publishing workflows so migration and modernization teams can extend the platform with their own domain-specific agents. It reduces the manual scaffolding previously required to operationalize custom agentic automation.

Lasso's Architecture Secures AI Agents with Intent Security

Coverage detailed Lasso Security's intent-based architecture for securing AI agents, combining automated red teaming that probes agent logic across three tiers of adversarial testing, from static payloads to dynamic multi-turn probing, to surface prompt injection flaws. Runtime protection sits at the API gateway using thousands of classifiers with sub-50ms checks, while an LLM-as-a-judge semantic layer inspects inputs and outputs to block data leakage and keep agents inside sanctioned scope. Lasso positions continuous validation and posture management as its differentiators against content-filtering guardrails.

Barracuda Analysis: IBM Report Sees Deepfakes Emerging as Top AI Attack Threat

Barracuda published analysis of IBM's Ponemon Institute research showing deepfake impersonation now accounts for 47% of AI-enabled breaches, with AI-enabled incidents making up roughly a quarter of all breaches. Barracuda notes AI-related breaches average about \$6 million versus the \$4.99 million global norm, and most target customer PII at roughly \$192 per record. It highlights that 85% of organizations plan to increase security spending, prioritizing alert triage, penetration testing, and vulnerability management.

Security Advisory**Fortinet****Application Security**

2026-07-31

Fortinet Publishes FortiWeb Mitigation Guidance for NGINX Flaw CVE-2026-42533

Fortinet issued technical guidance for defending against CVE-2026-42533, a heap buffer overflow in NGINX Open Source and NGINX Plus, using FortiWeb. With no default signature yet available, Fortinet recommends an HTTP protocol constraint limiting request URL length to 2KB with alert-and-deny action, plus a custom WAF signature with a supplied regex applied through the web protection profile. The advisory positions FortiWeb as a virtual-patching layer for upstream web server vulnerabilities.

FortiGuard Outbreak Alert: HTTP/2 Bomb Denial-of-Service Vulnerability

FortiGuard Labs issued an outbreak alert for CVE-2026-49975, an HTTP/2 denial-of-service flaw affecting default configurations of widely deployed web infrastructure. The alert details attack behavior, exposure assessment, and Fortinet protections spanning FortiGate, FortiWeb, and FortiNDR Cloud telemetry for detection and mitigation. Fortinet urges customers to validate configurations and apply relevant IPS and protocol protections to blunt volumetric HTTP/2 abuse against internet-facing applications.

Cloudflare MCP Portal Adds Manual OAuth Client Configuration

Cloudflare shipped a changelog update to its MCP Portal enabling manual OAuth client configuration for Model Context Protocol server connections. The change gives administrators explicit control over credentials and consent flows when brokering agent access to internal MCP servers, rather than relying solely on automatic client registration. It extends Cloudflare's governance controls for enterprise AI agent access.

Product Launch Akamai AI Data Delivery 2026-07-31

Akamai Cloud Adds NVIDIA RTX PRO 6000 Blackwell 8-Card GPU Instances for AI Inference

Akamai announced general availability of 8-card NVIDIA RTX PRO 6000 Blackwell Server Edition GPU instances on Akamai Cloud, targeting high-performance AI inference, AI-accelerated graphics, and advanced simulation workloads. The new plans deliver substantially greater VRAM than prior RTX 4000 Ada or Quadro RTX 6000 options, enabling larger models and longer context windows for language and multimodal inference. The 8-card configurations also expose PCIe topology to the VM via virtual NUMA to optimize memory performance and bandwidth.

Security Advisory Fastly Application Security 2026-07-31

Fastly Next-Gen WAF Adds Virtual Patch for CVE-2026-66066 (KindaRails2Shell)

Fastly released a Next-Gen WAF virtual patch for CVE-2026-66066, dubbed KindaRails2Shell, an arbitrary file read flaw in Ruby on Rails Active Storage that can escalate to remote code execution. The critical bug (CVSS 9.5) stems from unsafe libvips operations left enabled on untrusted image uploads, exposing secrets such as secret_key_base. Customers can enable the template rule from either the Fastly control panel's Virtual Patches section or the Next-Gen WAF console, choosing block or log behavior.

Security Advisory Barracuda Networks Application Security 2026-07-31

Barracuda MSP Threat Advisory: ChonkyChicken Credential-Stealing RAT

Barracuda MSP issued a threat advisory on ChonkyChicken, a modular credential-stealing remote access trojan that harvests browser credentials, hijacks active sessions, and enables lateral movement. Additional modules support remote command execution, network reconnaissance, and user surveillance. Barracuda links the malware to the TAG-195 Golden Chickens ecosystem, noting it spreads via ClickFix social engineering and abuses legitimate Windows utilities to evade detection. The advisory urges layered monitoring and credential hygiene for managed service providers.
