Zscaler and NVIDIA Partner to Deliver Gen AI-Powered Zero Trust

Zscaler announced a collaboration with NVIDIA to accelerate AI-powered Zero Trust, using NVIDIA NeMo Guardrails, Morpheus, and NIM inference microservices to enhance its ZDX Copilot digital-experience assistant. The integration adds real-time threat detection and streamlined IT operations across network, device, and application performance, with Morpheus processing high-volume streaming security data and NIM enabling scalable local LLM deployment. The partnership aims to strengthen proactive defenses and simplify network operations for enterprises.

Cloudflare Introduces Precursor: One-Click Behavioral Bot Defense

Cloudflare launched Precursor, a next-generation behavioral bot defense that runs continuously at Cloudflare's edge and inside browsers to analyze user sessions in real time. Instead of per-request CAPTCHAs, Precursor validates human plausibility across an entire session using signals like typing cadence, mouse movement, and scrolling rhythm, without recording exact inputs. It offers one-click, zero-code setup via an injected script and complements Bot Management and Turnstile. Cloudflare notes bots now generate roughly 57% of web traffic, making static checks increasingly ineffective.

Citrix Adds MCP Gateway to NetScaler for Unified AI Traffic Governance

Citrix expanded NetScaler with MCP Gateway capabilities to securely route, govern, and observe enterprise AI agent traffic to backend Model Context Protocol servers from a single platform. Enhanced NetScaler AI Gateway features add content-switching-based model routing and token-level usage tracking for LLM traffic, giving visibility into input/output tokens by team, user, or application. A single-pass architecture handles authentication, routing, security, rate limiting, and observability in one data-path pass to reduce latency. The enhancements are included at no extra cost for Citrix Platform License and Universal Hybrid Multi-Cloud customers.

Imperva Cloud Application Security July Release Adds AI Monitoring Dashboard

Imperva's July 12 Cloud Application Security release introduced a new AI Application Security Monitoring Dashboard providing high-level threat visibility, token usage, and policy enforcement. The update also adds Cloud WAF wildcard domain reuse across sites in an account, the ability to export top traffic analytics in DDoS event notifications, ASN organization names in the Account Takeover dashboard, and API Security changes that exclude OPTIONS and HEAD requests from Schema Protection by default. A new Imperva Terraform Provider (v3.39.0) and several recently mitigated CVEs round out the release.
